

### Featured Product . . . EnerMatic System

An EnerMatic Controller completely monitors and controls the engine.

Oil pressure and coolant temperature are measured. Switches for high temperature and low oil pressure are sensed for emergency shutdown.

External switches can be attached to shutdown and lock out the engine. Common to this category are door interlocks, intrusion sensors, fire detectors, and exhaust pyrometers.

Optional measurements include oil level and fuel level for external tanks.

Engines can be equipped for extended drain intervals. The first stage incorporates a dual oil filter assembly that adds about a gallon of oil to the system.

For even longer intervals between oil changes, an external oil tank is used with an oil pump that circulates oil through the engine under control of the EnerMatic.
