Electrical System Alarms

An alarm may save your life. If your electrical system is on the verge of collapse, wouldn't you want to know? The Energy Monitor II provides alarms for high and low battery voltage, high battery temperature, and both 50% and 80% depth of discharge. You can also program an alarm to occur at any depth of discharge.

All alarms can be individually enable or disabled.

A high voltage or high temperature alarm indicates a run-away regulator. A low voltage or low capacity alarm indicates a need to charge. Since the voltage and temperature alarms are programmable, you can set them at meaningful values . . . 12.6 Volts is low for a starter battery, but obviously not for a house bank. Don't let a disaster sneak up on you!
